

The AL13[®] batten system provides the traditional look of wood and durability of metal on walls and ceilings.

Battens are cut to size, assembled on site, and secured directly to the substrate for both interior and exterior applications.

Wind + Water 1

For exterior walls and ceilings, the battens are secured onto brackets that offset the system from the substrate surface for rainscreen applications. Air can also easily flow through this gap and the spacing between the battens, equalizing pressure on both sides.

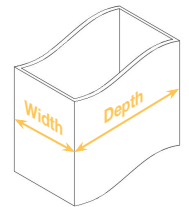

Fire 2

Aluminum battens and galvanized steel brackets used to make batten panels are non-combustible materials, making them suitable for applications compliant with stricter fire regulations.

Design Flexibility 3

Battens can be cut and configured to suit a variety of design preferences. 1in and 2in batten widths come in standard depths. Got an idea in mind? Reach out to us for your specific need.

Batten Width	Standard Section Depth			
1"	1"	2"	4"	5"
2"	2"	4"	6"	

Finish 4

The AL13[®] batten system is available in a variety of wood grain finishes that come with a 15yr finish warranty. Custom color matching is also available.
